Overview

If you are feeling the stress and strain of modern life a Wheatstone bridge and you want to quantify it, this handy breakout will do the job, no sweat! The Adafruit NAU7802 contains a super-high-resolution 24-Bit differential ADC with extra gain and calibration circuitry that makes it perfect for measuring strain gauges / load cells or other sensors that have four wires that are connected in a Wheatstone bridge arrangement ().

Each breakout comes with a NAU7802 ADC chip, plus some support circuitry, and 4 terminal blocks that can be used to connect a 4-wire sensor.

The E- pad connects to ground (often a black wire), the E+ pad connects to a generated voltage from the NAU7802 that can be configured from 2.4V to 4.0V for a solid positive reference (often a red wire).

Then A- and A+ pads connect to the differential outputs from the bridge. For example, connecting to a strain gauge these tend to be the white and green wires.

As the sensor is twisted and bent, the slight changes in resistance are converted to minuscule voltage changes that can be read by the NAU ADC for converting into force or mass measurements. You can use our <u>Arduino library</u> () or <u>CedarGrove's</u> <u>CircuitPython/Python library</u> () to configure and read the ADC for fast interfacing. Note that this sensor has a fixed I2C address, <u>if multiple sensors are desired on one I2C</u> bus, a multiplexer can be used ().

Pinouts

Power Pins

- VIN This is the power pin. To power the board, give it the same power as the logic level of your microcontroller - e.g. for a 3V microcontroller like a Feather M4, use 3V, or for a 5V microcontroller like Arduino, use 5V.
- AV This is the AVDD pin. It is the analog power supply pin and can supply 2.4V to 4.0V.
- GND This is common ground for power and logic.

I2C Logic Pins

The default I2C address for the NAU7802 is 0x2A.

- SCL I2C clock pin, connect to your microcontroller I2C clock line. There's a 10K pullup on this pin.
- SDA I2C data pin, connect to your microcontroller I2C data line. There's a 10K pullup on this pin.

• <u>STEMMA QT</u> () - These connectors allow you to connect to development boards with STEMMA QT / Qwiic connectors or to other things with <u>various associated</u> accessories ().

Terminal Block Pins

- A+ Connected to VIN1P, which is Non-Inverting Input #1. It is a differential output from the bridge.
- A- Connected to VIN1N, which is Inverting Input #1. It is a differential output from the bridge.
- E+ Connected to AVDD for a generated voltage from the NAU7802. It can be configured from 2.4V to 4.0V for a solid positive reference.
- E- Connected to common ground.

Data Ready Output Pin

• DRDY - Data Ready Output pin. It indicates when a conversion is complete and new data is available for readout

Power LED

• Power LED - In the bottom left corner, below the STEMMA connector, on the front of the board, is the power LED, labeled on. It is the green LED.

Python & CircuitPython

It's easy to use the NAU7802 with Python or CircuitPython, and the <u>CedarGrove</u> <u>CircuitPython NAU7802</u> () module. This module allows you to easily write Python code that reads the value from the NAU7802 ADC.

You can use this sensor with any CircuitPython microcontroller board or with a computer that has GPIO and Python thanks to Adafruit_Blinka, our CircuitPython-for-Python compatibility library ().

CircuitPython Microcontroller Wiring

First, wire up a NAU7802 to your board exactly as shown below. Here's an example of wiring a Feather M4 to the sensor with I2C using one of the handy <u>STEMMA QT</u> () con nectors:

Board 3V to ADC VIN (red wire) Board GND to ADC GND (black wire) Board SCL to ADC SCL (yellow wire) Board SDA to ADC SDA (blue wire)

You can also use the standard 0.100" pitch headers to wire it up on a breadboard:

Board 3V to ADC VIN (red wire) Board GND to ADC GND (black wire) Board SCL to ADC SCL (yellow wire) Board SDA to ADC SDA (blue wire)

Python Computer Wiring

Since there's dozens of Linux computers/boards you can use, below shows wiring for Raspberry Pi. For other platforms, please visit the guide for CircuitPython on Linux to see whether your platform is supported ().

Here's the Raspberry Pi wired to the ADC using I2C and a STEMMA QT () connector:

Pi 3V to ADC VIN (red wire) Pi GND to ADC GND (black wire) Pi SCL to ADC SCL (yellow wire) Pi SDA to ADC SDA (blue wire)

fritzing

Finally here is an example of how to wire up a Raspberry Pi to the ADC using a solderless breadboard:

Pi 3V to ADC VIN (red wire) Pi GND to ADC GND (black wire) Pi SCL to ADC SCL (yellow wire) Pi SDA to ADC SDA (blue wire)

fritzing

Python Installation of NAU7802 Library

You'll need to install the Adafruit_Blinka library that provides the CircuitPython support in Python. This may also require enabling I2C on your platform and verifying you are running Python 3. Since each platform is a little different, and Linux changes often, please visit the CircuitPython on Linux guide to get your computer ready ()!

Once that's done, from your command line run the following command:

• git clone https://github.com/CedarGroveStudios/ CircuitPython NAU7802

This clones the CircuitPython_NAU7802 repository from GitHub. Then, you'll need to copy the cedargrove_nau7802.py library file to your Python packages folder running the following command:

 sudo cp -r ~/CircuitPython_NAU7802/cedargrove_nau7802.py /usr/ local/lib/python3.9/dist-packages

CircuitPython Usage

To use with CircuitPython, you need to first install the NAU7802 library, and its dependencies, into the lib folder on your CIRCUITPY drive. Then you need to update code.py with the example script.

- 1. First, download the latest CircuitPython Community Bundle ()
- 2. Copy the cedargrove_nau7802.mpy file to the CIRCUITPY/lib folder.
- 3. Copy the nau7802_simpletest.py file from the examples folder to the CIRCUITPY drive.
- 4. Rename nau7802_simpletest.py to code.py.

Next, download the latest <u>CircuitPython Library bundle</u> (). Copy the adafruit_bus_devi ce and adafruit_register library folders to the CIRCUITPY/lib folder.

Your CIRCUITPY/lib folder should contain the following folders and file:

- adafruit_bus_device/
- adafruit_register/
- cedargrove_nau7802.mpy

Python Usage

Once you have the library installed on your computer, copy or <u>download the following</u> <u>example</u> () to your computer, and run the following, replacing code.py with whatever you named the file:

python3 code.py

Example Code

nau7802_simpletest.py

If running CircuitPython: Once everything is saved to the CIRCUITPY drive, <u>connect to</u> the serial console () to see the data printed out!

If running Python: The console output will appear wherever you are running Python.

```
Adafruit CircuitPython REPL
code.py output:
*** Instantiate and calibrate load cells
Digital and analog power enabled: True
REMOVE WEIGHTS FROM LOAD CELLS
channel 1 calibrate.INTERNAL: True
channel 1 calibrate.OFFSET:
                                 True
... channel 1 zeroed
READY
=====
channel 1 raw value:
                          1309
=====
channel 1 raw value:
                          1472
=====
channel 1 raw value:
                          2329
=====
channel 1 raw value:
                         3956
=====
```

Attach a strain gauge with four wires to the four terminal inputs. Now try applying force on the gauge to see the values change!

First you import the necessary modules and libraries. Then you instantiate the sensor on I2C.

Then you're ready to read data from the ADC, including the initial information printed to the serial console.

Finally, inside the loop, you check the value from the ADC.

The terminal inputs' raw value will print to the REPL. You'll see the number increase or decrease depending on the amount of force you apply to the strain gauge.

That's all there is to using the NAU7802 with CircuitPython!

Python Docs

Python Docs ()

Arduino

Using the NAU7802 with Arduino involves wiring up the sensor to your Arduinocompatible microcontroller, installing the <u>Adafruit_NAU7802</u> () library and running the provided example code.

Wiring

Wire as shown for a 5V board like an Uno. If you are using a 3V board, like an Adafruit Feather, wire the board's 3V pin to the NAU7802 VIN.

Here is an Adafruit Metro wired up to the NAU7802 using the STEMMA QT connector:

Board 5V to ADC VIN (red wire) Board GND to ADC GND (black wire) Board SCL to ADC SCL (yellow wire) Board SDA to ADC SDA (blue wire)

Here is an Adafruit Metro wired up using a solderless breadboard:

Board 5V to ADC VIN (red wire) Board GND to ADC GND (black wire) Board SCL to ADC SCL (yellow wire) Board SDA to ADC SDA (blue wire)

Library Installation

You can install the NAU7802 library for Arduino using the Library Manager in the Arduino IDE.

🗯 Arduino File Edit	Sketch Tools Help		
	Verify/Compile	ЖR	sketch_jun25a Arduino 1.8.13
	Upload Upload Using Programmer	жሀ	
sketch_jun25a	Export compiled Binary	∵ະສ	
<pre>void setup() {</pre>	Show Sketch Folder	жк	
// put your setup code rier	Include Library	•	Manage Libraries 쇼윎I
}	Add File		Add .ZIP Library

Click the Manage Libraries ... menu item, search for NAU7802, and select the Adafruit NAU7802 Library library:

C Library Manager	×
Type All V Topic All Nau7802	
Adafruit HAU7802 Library by Adafruit Arduino library for the NAU7802 ADC converter in the Adafruit shop Arduino library for the NAU7802 ADC converter in the Adafruit shop More info	^

If asked about dependencies, click "Install all".

If the "Dependencies" window does not come up, then you already have the dependencies installed.

If the dependencies are already installed, you must make sure you update them through the Arduino Library Manager before loading the example!

Load Example

Open up File -> Examples -> Adafruit NAU7802 Library -> nau7802_test and upload to your Arduino wired to the sensor.

```
#include <Adafruit NAU7802.h>
Adafruit NAU7802 nau;
void setup() {
  Serial.begin(115200);
  Serial.println("NAU7802");
  if (! nau.begin()) {
     Serial.println("Failed to find NAU7802");
  Serial.println("Found NAU7802");
  nau.setLD0(NAU7802_3V0);
  Serial.print("LDO voltage set to ");
  switch (nau.getLDO()) {
     case NAU7802_4V5: Serial.println("4.5V"); break;
     case NAU7802_4V2: Serial.println("4.2V"); break;

Attach a strain gauge with four wires to the four terminal inputs on the NAU7802. Upload the sketch to your board and open up the Serial Monitor (Tools -> Serial Monitor) at 115200 baud. You should see the values from the ADC being printed out. Y ou'll see the value increase or decrease depending on the amount of force you are applying to the strain gauge.
